Location to nearest town and county: Moab - Grand Co.

Latilong block number: 18

Previous status: 1-3 records Recommended status: one more record

Habitat change from No to change

Abundance change from No to change

Willowed under ponderosa trees
REASONS FOR RECOMMENDATION(S)

Observations supporting your recommendations: (date(s) of observation(s) or other pertinent information):

Sept 13, 87 One or more birds. I had several Thrushes with many other birds. They were chasing an Owl. One Thrush - the Veery started singing its ~~spring~~ song, which I am quite familiar with over and over again. I was able to watch the bird with binocs for a short while.
Number of birds seen:

ONE veery is all I can be sure of but there were several other Thrushes present. I did not see them so they could be Swanson's or Hermits.
Significant behavioral observations:

The owl was driving the birds mad. There was also several western Blue birds present.
