Description of bird: Size, colors, all field marks OBSERVED. - Unique features of this individual, if any.

The bird was small (4-5 inches long), gray on back, white below with a black cap.

It had a tiny white eye-ring.

The tail was all black except the outer tail feathers which were white the full length of the tail.

The tail was all black except the outer tail feathers which were white the full length of the tail.

The tail was all black except the outer tail feathers which were white the full length of the tail.

Received a call about  $2\frac{1}{2}$  weeks before this sighting from Dr. Bob Bond informing me that he had observed a male and a female of this species building a nest in the Beaver Dam Wash area and gave me directions on how to find the tree. He indicated that he had taken about two rolls of film which would be verification of a state record. When I arrived at the location he had described I found what may have been the nest in terms of the description of the the exact location in the mesquite tree he had given, but no birds. The nest was empty. After walking around the immediate vicinity and not seeing or hearing it, I resorted to the taped recording as I walked north along the road toward Lytle's ranchhouse. About half way between the cattleguard and the corrals where I had parked the gnateatcher responded to the call. I was than able to see all the salient field—marks. Later on in the afternoom I went to Welcome Spring and saw two Blue-gray Gnat-catcher's which provided good comparisons in terms of call notes and fieldmarks. The habitat the two species were in was quite different—low desert scrub and desert wash for the Elack-tailed, and live oak, pinion—juniper habitat for the Blue-gray.

Field marks which were <u>not</u> seen. Why not?	Variations from expe	ected field marks.
